

Stop stitching your AI production stack together.

Studio is the production operating layer for AI systems: durable orchestration, AI-native evaluation, enterprise controls and flexible deployment. Move agentic workflows from pilot to production without months of glue work. [1,3]

Persist state

Retry failed steps

Pause + resume

Illustrative workflow view; based on documented Workflows behavior. [1,2]

ASML, ABANCA, CMA CGM, France Travail, La Banque Postale and Moeve already run Workflows on critical processes. [1]

Built for enterprise developers and business teams taking agentic workflows into production.

PUBLIC PREVIEW · [2,5]

Why Studio beats a stitched stack

One production loop, not another layer of glue.

RUN DURABLY

Keep critical processes moving through failure.

Workflows persist state, retry failed activities, wait for human input and resume from history. Built on Temporal, extended with AI-specific streaming, payload handling and observability. [1,2]

Less recovery code. Fewer brittle automations.

OBSERVE & EVALUATE

Measure the system, not just the model.

Agents, Connectors, experiments, judges and traces run in one operating loop, so production behavior stays observable and testable end to end. [1,3]

Faster debugging. Safer iteration.

CONTROL & DEPLOY

Standardize without forcing one deployment model.

DEPLOYMENT

Hybrid · Dedicated · Self-hosted

ACCESS & GOVERNANCE

RBAC · SAML SSO · Workspaces · Audit logs

COMPLIANCE

SOC 2 Type II · ISO 27001/27701

Control access, data boundaries and operations. [3,4,6]

DOCUMENTED WORKFLOW IMPACT

KYC review:
hours → minutes

A documented KYC review that normally takes hours of analyst time completes in minutes with Workflows. Studio surfaces each step in a structured timeline with OpenTelemetry tracing. [1]

Also documented: cargo-release automation with human approval, and traceable support triage. [1]

Hybrid Workflows: what stays where

Workers and business logic stay in your environment. Studio coordinates execution. [2]

Mistral Studio

Orchestrator
State & history
Task dispatch

OUTBOUND

Your environment

Workflow code
Workers on K8s / VMs
Business logic

Outbound workers

SDK-layer encryption

Payload offloading

Workers connect outbound. Inputs and outputs flow through the platform, with encryption and payload offloading available. Enterprise Studio can also run in private cloud or on-premises. [2]

Evaluate Studio against your production architecture.

Review deployment fit, data boundaries and enterprise controls with Mistral, using your real workflow.
